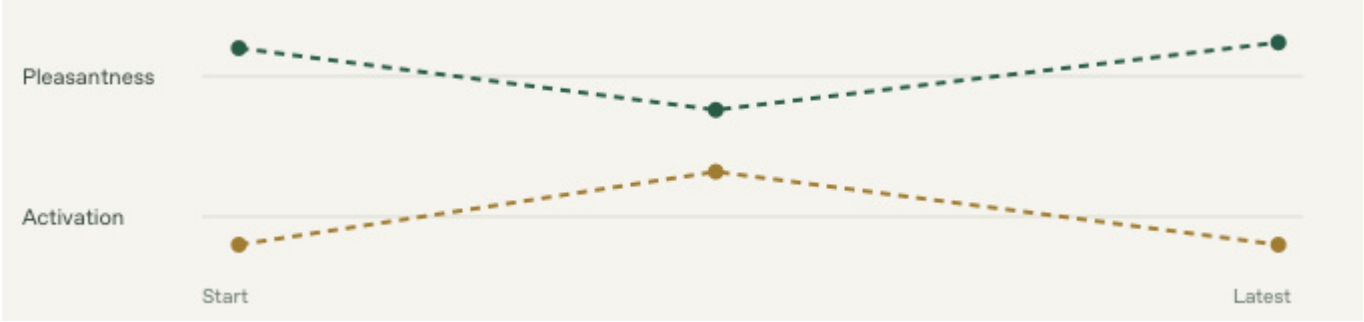
Your session, in your words

Example session · synthetic check-ins · 15 minutes · 3 CMA check-ins

Enjoy the challenge

Pleasantness and activation

Similar pleasantness · similar activation



Each dot is a check-in. Dashed connections guide the eye; unreported time is unknown. Both scales run from −1 to +1.

First check-in	Most activated check-in	Latest check-in
Calm	Frustrated	Calm
Pleasant · low energy	Unpleasant · high energy	Pleasant · low energy

First to latest: pleasantness +0.10; activation +0.00.

Where your check-ins landed

Pleasant · low energy: **2 of 3** · Unpleasant · high energy: **1 of 3**

Counts refer to check-ins, not time spent in a feeling.

What stands out

You recorded at least one unpleasant, highly activated moment. Compare it with your later check-in rather than treating high energy alone as a problem.

For your next session

For the next session, consider a brief pause between attempts and check in again afterwards.

CMA describes pleasantness and activation. Coordinates are adjustable check-in values, not clinical measurements. Facial estimates, hand gestures and input activity are not used to invent an emotional history.
